

MACHINES

each machine, its share, its state, uptime and awake share — with the key that undoes the current state

LIVE CLAIMS

what is claimed, by whom, how old the claim is, the worker and the task's state

PLANS AWAITING REVIEW

submitted plans, plus **plans written but not submitted**, and **plans changed since submission**

AWAITING REVIEW

open pull requests, their review decision, their check state, and comment counts

ACTIVITY FEED

ledger records in plain English, attributed to a person

DAEMON LOG

the tail of `swarm.log`, filtered by level

p pause **r** resume **t** throttle **s** stop **?** help
w choose a worker **f** freeze or unfreeze **a** reassign **e** take over an epic
v review a plan **x** answer a test-scope question **y** answer a worker's question
o open the ticket **0** the pull request **n** set the global cap **l** cycle the log level

reads

every other key: an ordinary ledger record

THE LOCAL CLONE

The same local clone everything else reads. A view of files, not a dashboard onto a service — which is why it works offline, and why two Boards on two machines agree.

****m** approve and merge**

The only action that is not a ledger record: it runs the real `gh approve-and-merge`. It warns on red or pending checks, and merges over red only on explicit confirmation.
