

1 THE WORKER'S WORKTREE

WHO WAITS the worker, before done

This change does not break what it touches.

The scope is agreed, not assumed. `testscope` proposes one from the diff:

`none` `targeted` `neighbours` `full` — a human answers on the Board x

done: push, open the pull request, wait for the checks, up to `checks_timeout`

2 CI, ON THE PULL REQUEST

WHO WAITS the human, before merging

The merge result is sound.

`swarm/<TASK>` + `the base` → `refs/pull/N/merge`

A `pull_request` workflow tests the merge of the branch into the base, not the branch. It is the only place a conflict between two independently green branches is caught.

a human approves and merges

3 CI, ON THE DEFAULT BRANCH

WHO WAITS everyone, continuously

The branch is sound after the merge.

NOT HYPOTHETICAL

Two branches each passed, their merge resolved a conflict badly, and nothing had run the merged result — it left the default branch unable to even collect its tests. Card 2 is what prevents that.
